From the N. C. Agricultural Bulletin. What are field experiments, and what good is expected to be derived from them? What detailed plan shall be originated and how shall it be executed? These and other questions will be answered in the following article, and it is to be hoped that our people will follow the course of the work already com-

month to month. The object of experiments in the field is to determine practically by results obtained in nature's laboratory what course shall be pursued in growing a given crop on a given soil. We have obtained scientific results in the chemical laboratory, but will these results be resched in the field where the conditions are so changed, where the crops are affected by the heat of the sun, the beating of rains and hail, the cool of the night? Besides these meteorological conditions which affect our expectations, there are in addition complicated changes which must necessarily be wrought in the soil by the chemical and mechanical agencies there met with. The conditions are so different therefore that we can not depend on the result of the artificial laboratory to be entirely what will occur in our natural labomust be compared and a conclusion reached. Work in the field then is as necessa-

Field work of an experimental nature has for its object the analysis of the soil so that it can be determined what elements are lacking in it necessary for the growth of the plant; and to determine which of these elements singly, or which combination, is especially needed for a certain orop. The former of these results can be obtained from experiments in a single locality, the latter from the results from many localities so combined and studied in connection with each other, that a general opinion can be reached. But will the results of one locality, show-Experiment Station would answer the requirements of every other portion of the State. But this is not the case. The nature of the soil varies to such an extent that one set of experiments in one place, no matter how carefully conducted, or how scientifically, or how much precision is used, will not be suitable to any other vexing question would be greatly simplified. But the soil is very different and the condition in respect to the weather are very different. We must, therefore, careach in reference, not only to its own loeality, but with other results in other sections, in order to verify and to generalize.

These experiments are nothing more than an analysis of the soil, psing Nature's methods of the chemical laboratory. It is often thought that a chemical ex-

amination of any soil will reveal the true value of the ingredients contained in it. Many consequently have the idea that to analyze the soil chemically is sufficient to show what elements are present and how much of these elements can be utilized by the plant in the process of its growth. And further, that by knowing the mineral constituents of the matured plant and the total amount of these constituents extracted by the crop, it will be an easy step to ascertain what mineral fertilizers are needed to apply to the soil to make up any deficiency caused by their absence from the soil, or to make good what is extracted by the crop.

The fallacy of the reasoning, however, lies in the fact that a chemical examination of the soil, while it does give the total quantity of its constituents, it does not give the quantity available to the plant, such as can be utilized by the plant. This fact is all-important, for there may be plant food in abundance, in the soil, yet in such a form that it is impossible for the plant to derive any benefit from its presence, though it may lie in intimate contact with its numerous roots. Many of our ordinary feldspathic rocks contain in every 100 pounds as many as ten pounds of potash. Yet these ten pounds-almost from the Northern Markets, where he has secured equivalent to 100 pounds of Kainit-are all the latest Novelties and at in such an insoluble, unavailable form, that they are absolutely unserviceable as plant food, unless by some process of disintegration and decomposition, that they may become changed to a form which the plant can take up.

The thorough chemical examination will give the quantity of potash present, and likewise the quantity of the other chemical elements, but the science of chemistry has not yet devised an exact method for determining the proportion of these constituents, which is available to the needs of the plant, and which can be used by it in its growth. Chemistry is constantly advancing, new theories are brought forward, new methods are studied. It may not be a very distant day before reliable data will be obtained, which will give, through chemical investigation, the exact proportion of the total mineral elements present, which will be available to plant growth.

Well Said.

[From the Farmer's Call of Quincey, Ili.] In the August Southern Cultivator (the oldest and best Southern Agricultural Journal), Mr J. H. Wilson of Lowell, N. C., so well expresses our notions of the conditions that will bring prosperity to Southern agriculture, and to the agriculture of every other section as well, that we reproduce what he says on this point:

cultivation and management and then I will sing it into the ears of my country. men until they hear my voice, for I want to see them improve and grow rich, which cannot be done unless they have diversity of crops and home markets for everything they raise, Home markets can not well be had without manufacturing and mining enterprises, and these cannot exist without protection from cheap labor abroad. The finest farms we have, the more acres cultivated to the area of land, the best paid agricultural labor we have, the greatest diversity of products raised, are to be found where manufacturing enterprises abound, which furnish a market

for these products; and these farms are found in New England and Middle States. The South wants to raise wheat, oats, corn, grasses, all sorts of garden truck, apples, peaches, and the small fruits, besides cetton; also, cattle, horses and hogs, and see List. ing; but she needs a marke and a remun- Feb. 10, '88.

erative one for these things. She must remember, however, that she is fifty years behind the New England and Middle States, and that these States made their farmers rich by having immense manufacturing communities, supporting large cities to buy from them."

The holding of such views by a repre sentative North Carolina planter certainly marks an epoch; and as Mr Wilson is by no means alone, we think the outlook for Southern sgriculture is very promismenced in various portions of the State, a ling. The South has the coal, iron, lumdetailed report of which will appear from ber, etc., to make it one of the greatest manufacturing regions on the globe; and when its manufacturing resources are developed, the value of its land will be multiplied ten-fold.

Household Recipes.

BLACKBERRY JAM .- To every pound of berries add a pound of sugar; mix without a particle of water; cook for two hours.

CANNING PIEPLANT,-Pick when it is long and good, cut up and put in glass fruit cans, press down, cover with cold water, seal and put away. It will keep fresh till it comes again. In sections where fruit is scarce it can be so easily

SPICE CARES.—One large cup butter and lard mixed, one coffee cup sugar, one cup molasses, one-half cup water, one tablespoonful ginger, one tablespoonful cinratory-the field. The results of each namon, one tablespoonful cloves, one teaspoonful soda, dissolved in hot water, flour for stiff dough. Roll out rather ry as the work in the laboratory, and the thinner than sugar cakes, and bake two should be combined to reap the best | quickly.

> SAUCE FOR FRITTERS.—One cupful of water, half a cupful of sugar, one round tablespoonful of corn starch; the juice of half a lemon, a bit of butter. Boil the water. Mix the starch with the sugar dry and stir them in. Add the lemon juice and butter. Let boil transparent. Pour a large spoonful over each fritter as they are dished up.

LITTLE LOVES .- Take a quarter-pound of fresh butter and beat it to a cream. Add four tablespoonfuls of fine flour, two onness of loaf sugar, one ounce of candied peel, cut into thick slices, six sweet and ing the needs of the soil there, be suita- six bitter almonds, blauched and cut ble to another section? If this would be lengthwise. Mix these ingredients to the case, experiments carried on at the gether, form them into rounds, and bake them in six pattypans.

SAUCE .- Half a bowl of brown sugar, glass of rose water stirred to a cream. Goods that could be found in the market. Dredge in a tablespoonful of flower, and add a tea cup of boiling water, stirring well for two or three minutes; grate in a Are beyond reach of all competition. I am half notmeg; use the moment it is done. simply showing a locality. If they would be suitable, this It is a delicious French dessert, although the title is very homespun.

SPONGE CAKE ROLL.-Take two teagups of sifted flour, two heaping teary on these experiments in as many dif- spoonfuls of baking powder; into this ferent localities as possible, and study break six good-sized eggs; beat all well together, turn into square jelly tins, and bake in a quick oven to light brown. When done, turn out on a molding-board, and spread quickly with jelly; roll carefully out, and wrap each roll in a clean forces to direct it, instead of the heat of napkin and serve. The eggs are not beatthe furnace, the action of acids, and other en separately, and the quicker the cake is put together the better it will be.

APPLE JELLY. - Apple jelly, which is delicious with custards and cakes, can be FALL AND WINTER SEASON, 1888. made at any time during the winter. Take half a peck of juicy, tart apples, quarter and core, but do not pare them; put into a kettle with two lemons cut up with them and cover well with water. Let them cook until reduced to a pulp, when strain through a flannel bag. To every tumbler of juice add two-thirds of a tumbler of white sugar. Boil hard for twenty minutes, put in a glass and cover next day, using brandied paper next the jelly and covering the glasses with paper wet with flour paste.

MIHALOVITCH'S Hungarian Blackberry Juice-Non-Al

The Great Stomach Remedy. As a remedy against Diarrhoa and Dysentery, e reproduce what he says on this point: the juice of the Blackberry has been known and valued since time immemorial, and it is, therefore, needless for us to debate that subject any further than to say, that this particular Hungarian Blackberry Juice, of which the blackberry

is grown in a country which is famous for pro-

lucing the best fruits on the globe, will bear out

its excellence against all others. HUNGARIAN BLACKBERRY JUICE AS A TABLE Luxury.-The fine aroma, pleasant taste and rich body of the juice makes it a desirable article for table use. It can be mixed in all proportions with all kinds of drinks, such as Lemonades Sherbets, Wines, Liquors, etc., and will impart to them a delicious aroms, a fine acid taste and a luscious body, which no other juice can do For sale at
